Supplementary Table 1. Threshold values used to classify genotypes into four susceptibility classes: low-susceptible (LM), mild susceptible (MS), high susceptible (HS), and very-high susceptible (VHS). These values were obtained using an unsupervised k-means clustering approach to the mean disease severity values obtained from the detached and in planta inoculation assays. For each dataset, k-means clustering was performed with k = 4, and the resulting cluster centroids were ordered from lowest to highest susceptibility. Class boundaries were then defined as the midpoints between adjacent centroids, yielding the four ordinal categories.

Categories	Detached trial	In planta trial
LS	<2.1855	<2.7653
MS	2.1855-3.3877	2.7653-4.4037
HS	3.877-4.7634	4.4037-5.5463
VHS	>4.7634	>5.5463

Supplementary Table 2. Estimated marginal means (emmeans) of necrosis length (cm) for each genotype in the detached-twig trial. For each genotype, the table reports the estimated marginal mean (emmean), standard error (SE), degrees of freedom (df), and lower and upper confidence limits (lower.CL and upper.CL). Letters indicate groupings based on post hoc multiple comparisons; genotypes sharing at least one letter are not significantly different at the specified significance level.

Supplementary Table 5. Estimated marginal means (emmeans) of necrosis length (cm) for each genotype in the in planta trial. For each genotype, the table reports the estimated marginal mean (emmean), standard error (SE), degrees of freedom (df), and lower and upper confidence limits (lower.CL and upper.CL). Letters indicate groupings based on post hoc multiple comparisons; genotypes sharing at least one letter are not significantly different at the specified significance level.

Supplementary Table 6. Presence or absence of disease symptoms across the citrus genotypes analyzed in the in planta assay. For each genotype, the occurrence of gum exudation (gum), pycnidia formation (pycnidia), and blighting symptoms (blighting) is reported as yes/no. The cooccurrence column summarizes the combination of symptoms observed for each genotype.

Genotype	Gum	Pycnidia	Blighting	Co-occurrence
Fantastico bergamot	yes	no	yes	gum only
Femminello bergamot	yes	no	no	gum only
Ovale sweet orange	yes	yes	yes	gum + pycnidia + blighting
